In engineering, a crank-and-slider mechanism can be used to change circular motion into motion back and forth in a straight line.

In the diagrams below, the crank [OD] rotates about the fixed point $O$. The point $C$ slides back and forth in a horizontal line. [CD] is the rod that connects $C$ to the crank. The diagrams below show three of the possible positions for $C$ and $D .|O D|=10 \mathrm{~cm}$ and $|D C|=30 \mathrm{~cm}$.

(Starting position)

(a) The diagram below shows a particular position of the mechanism with $|\angle D C O|=15^{\circ}$. Find $|\angle C O D|$, correct to the nearest degree.

(b) As $D$ moves in a circle around $O$, the angle $\alpha$ in the diagram below increases. The distance $|C X|$ can be considered to be a function of $\alpha$ and written as $f(\alpha)$.
(i) Write down the period and range of $f$.

| Period $=$ | Range $=$ |

(ii) Complete the table below for $f(\alpha)$.

Give your answers correct to 2 decimal places where appropriate.
(Note: Diagram 1 at the start of this question represents $\alpha=0^{\circ}$ ).

| $\alpha$ | $0^{\circ}$ | $90^{\circ}$ | $180^{\circ}$ | $270^{\circ}$ | $360^{\circ}$ |

| $f(\alpha)$ <br> $(\mathrm{cm})$ | 30 |  |  |  |  |

(iii) Use your values from the table to draw a rough sketch of $f$ in the domain $0^{\circ} \leq \alpha \leq 360^{\circ}$.

(iv) Referring to Diagrams 1, 2, and 3 near the start of this question, for which of the three positions of the mechanism will a 1 degree change in $\alpha$ cause the greatest change in the position of $C$ ? Explain your answer.

(c) The diagram below shows another crank-and-slider mechanism with different dimensions. In the diagram, $|A B|=36 \mathrm{~cm},|A X|=31 \mathrm{~cm}$, and $|\angle B A O|=10^{\circ}$.
(Note: $|\angle O B A| \neq 90^{\circ}$ )
Find $r$, the length of the crank. Give your answer in cm , correct to the nearest cm .
